

Standard Operating Procedure (SOP) for Consultants

1. Communication & Responsiveness

- Consultants must maintain **clear and professional communication** at all times.
- Must be **proactively available and responsive**, especially during market hours.
- Any delays in updates or responses should be communicated to the Ops team promptly.

2. Trade Report Sheet Maintenance

- Every consultant is responsible for **maintaining the Trade Report Sheet** in the **standardized format** shared.
- The sheet must be **updated regularly and accurately** with clear entries for each call.
- Historical performance and key trade parameters must be easily accessible for review.

3. Performance Metrics

- **Minimum Success Rate:** Consultants must maintain a **minimum of 65% accuracy** in trade calls.
- This is monitored weekly and monthly. Underperformance may require reassessment or realignment.

4. Frequency of Reports

- **Consistent reporting** is crucial: Aim for **4-5 reports per week**. (Maximum 14 Calls in a

week)

- Only **Intraday and Swing trades** are to be shared. No scalping or long-term calls.

5. Trade Execution Parameters

- **Risk-to-Reward Ratio (R:R):**

- **T1:** At least 1:1.5

- **Targets and Stop Loss:**

- Should be appropriate to the trade's time horizon (preferably close to expiry).
- General guideline: **TP/SL $\geq$ 2.5%-3%**, unless market volatility is low.

- **SL% & TP%**

Set SL so the *leveraged* stop-loss is between **18-22%** using: **Leverage = 20 / SL%**.

TP% (with leverage) must also be **accordingly as per the RR**

Leverage:

- Must be mentioned based on market conditions.
- Always specify leverage clearly along with TP and SL%.
- No trade with 1x leverage should be given.

- **Entry Range:**

- Must fall within a **0.5% - 1.5% range**. (10% of SL/TP)
- **The token price must be within this range at the time of sharing the report.**

- **Trade Structure (Mandatory):**

- One Entry Range
- One Stop Loss
- One Target

- No DCA (Dollar-Cost Averaging)
- No Trailing Stop

6. Validity of Trades

- **Intraday Calls:** Valid till **11:59 PM IST the next day** (e.g., shared today at 5 PM → valid till 11:59 PM IST tomorrow).
- **Swing Trades:** Valid for **2 or more days** depending on market conditions and type of call. **(Cap- 7 Days)**
 - Regardless of entry time, all swing trades **expire at 11:59 PM IST** on the final day.
- If a trade misses the entry range by <1%, the consultant may manually request to close the report.

7. Charts & Report Format

- Chart & Note/Reason is mandatory.
- Charts must be clean, simple, and informative.
- COINDCX and dimension, dark mode
- Report format should be consistent, structured, and easy to understand by all users.

8. Token Selection & Allocation

- Calls should only be made on **CoinDCX [Futures](#)** listed tokens.
- Focus distribution:
 - **BTC & ETH & SOL:** 35–40% of total calls.

- **BTC:** Must constitute **at least 20%** of total calls.
- The focus should be on tokens within the top 50–100 market cap range, while avoiding calls on low-cap tokens.

9. Situational Strategy Guidelines

When to Slow Down:

- High-impact macro events (Refer to Macro Calendar).
- Major token-specific news/events (check Token News).
- Token unlocks (verify via Unlocks website).
- Late Friday evenings (weekend choppiness).
- If the market is highly volatile or following consecutive SL hits.

When to Push More:

- BTC shows strength or stable uptrend.
- BTC Dominance (BTC.D) is declining (favorable for altcoin activity).
- Positive macroeconomic indicators and strong global equity markets.

10. Cancellation Policy (Post Trial Phase)

- Cancellations must be pre-approved by the **Ops and Research team on the telegram group**.
- Use **pre-drafted standard messages** to notify users of cancellation.
- **Monthly cancellation cap:** Max 8-10% of total reports.

- Exceeding this requires **written justification and approval**.

Valid Cancellation Scenarios:

- Unexpected FOMC or economic policy announcements.
- Token-related or global market-impacting news.
- Sharp volatility that changes the trade setup dramatically.
- If a trade remains sideways within its timeframe, consultants can close it manually based on discretion and analysis.

11. Sideway call application

- In call validity, one can increase the days as a buffer to avoid sideways calls.
Consultants should work on having sideways calls as minimum as possible.
- If in any given month Sideways calls are **more than 5%** of total calls shared then **sideways calls would be considered as Stop loss calls** and would be included as denominator for Success rate calculation.
